

*Security guidelines
for S@T Push*

Copyright © 2019 SIMalliance Ltd.

August 2019

The SIMalliance recommends to implement security for S@T push messages. This security can be introduced at two different levels:

1. At the network level, filtering can be implemented to intercept and block the illegitimate binary SMS messages
2. At the SIM card level, the Minimum Security Level - MSL - attached to the S@T browser in push mode can force Cryptographic Checksum + Encryption (MSL = 0x06 at least)

In such cases where the replay of legitimate messages could lead to undesirable effects, MSL with Cryptographic Checksum + Encryption and anti-replay Counter is recommended (e.g. 0x16)
